## STORMWATER SAMPLING - NEW SERVICE TAKES THE GUESS WORK OUT OF IT!

Press Release

A Connecticut firm, Sailer Environmental, has announced a new service, which will alert those responsible for stormwater sampling, when rainfall of sufficient duration is expected to occur at a permitted site. Currently, specific sampling requirements in most states include observing the duration of stormwater flow, and having a certain rainfall amount, before a stormwater sample is to be taken at a discharge point.

In many locations, particularly where thunderstorms are a common occurrence, the protocol is inefficient and complicated, as environmental personnel responsible for sampling mobilize to a site, only to find that it is not raining at the permitted site, although it is raining where they live. There are also many "false starts", where the rainfall does not last long enough to produce stormwater flow of the duration needed prior to taking a sample.

The new service uses a combination of weather service/individual storm rainfall amount predictions and automated notification technology. Using this service, there is a high probability that a monitorable stormwater runoff event will occur after sampling personnel are alerted.

The service is particularly useful where those with stormwater sampling responsibilities must cover more than one site.
